Objectives

Cardoen et al. (2009). Optimizing a multiple objective surgical case sequencing problem. Int. J. Prod. Econ 119(2) pp. 354-366.
Duma & Aringhieri (2019). The management of non-elective patients: shared vs. dedicated policies. Omega 83 pp 199-212.

Uncertainty

Surgery Duration: the Real Operating Time (ROT) differs from the Estimated Operating Time (EOT).

Uncertainty

Surgery Duration: the Real Operating Time (ROT) differs from the Estimated Operating Time (EOT).

Emergency Surgeries: non-elective patients need to be inserted within the daily elective schedule (flexible policy).

Uncertainty

Surgery Duration: the Real Operating Time (ROT) differs from the Estimated Operating Time (EOT).

Emergency Surgeries: non-elective patients need to be inserted within the daily elective schedule (flexible policy).

No-shows: some patients do not showing up the day of surgery.

Prior Papers

Few prior studies deal with at least two of the three defined **procedures** (AP, SP, and TP) under uncertainty.

Paper	AP	SP	TP	Other decisions	Uncertainty	Objectives	Methodologies
Testi et al. (2007)	✓	✓	✗	MSS	surgery duration	overtime, OR utilization, throughput, bed utilization	DES, ILP, heuristics
Batun et al. (2011)	✓	✓	✗	ORs to be opened, physician-patient assignment	surgery duration	overtime, idle time, financial costs	SMIP
Landa et al. (2016)	✓	✓	✗	overtime allocation	surgery duration	OR utilization, cancellations	SMIP, metaheuristics
Aringhieri et al. (2016)	✓	✓	✗	real-time management	surgery duration	overtime, OR utilization, throughput, cancellations, indirect waiting time, % patient within due date	DES, online algorithms
Duma et al. (2019)	✓	✓	✗	OR policy, real-time management	surgery duration, non-elective patients	overtime, OR utilization, throughput, cancellations, indirect waiting time, % patient within due date	DES, online algorithms
Wang et al. (2022)	✓	✓	✗	partitioning	surgery duration, non-elective patients	overtime, idle time, OR utilization, throughput, cancellations, indirect waiting time, % patient within due date	DES

Mathematical Models

Assumptions

Emergencies: at most one emergency per OR block, arrival with fixed probability and uniform distribution over the OR block duration (= overall Poisson process), duration has lognormal distribution, emergency surgery starts as soon as possible.

Assumptions

Emergencies: at most one emergency per OR block, arrival with fixed probability and uniform distribution over the OR block duration (= overall Poisson process), duration has lognormal distribution, emergency surgery starts as soon as possible.

Surgery Duration: EOT depends on surgical procedure, ROT has lognormal distribution with mean equal to EOT.

Assumptions

Emergencies: at most one emergency per OR block, arrival with fixed probability and uniform distribution over the OR block duration (= overall Poisson process), duration has lognormal distribution, emergency surgery starts as soon as possible.

Surgery Duration: EOT depends on surgical procedure, ROT has lognormal distribution with mean equal to EOT.

Children / Infectious Patients: at most one child / infectious per surgery block, always scheduled at the beginning / end.

Assumptions

Emergencies: at most one emergency per OR block, arrival with fixed probability and uniform distribution over the OR block duration (= overall Poisson process), duration has lognormal distribution, emergency surgery starts as soon as possible.

Surgery Duration: EOT depends on surgical procedure, ROT has lognormal distribution with mean equal to EOT.

Children / Infectious Patients: at most one child / infectious per surgery block, always scheduled at the beginning / end.

Cancellations and Overtime: overtime is assigned if expected completion time is less than maximum overtime, otherwise surgery is cancelled.

Assumptions

Emergencies: at most one emergency per OR block, arrival with fixed probability and uniform distribution over the OR block duration (= overall Poisson process), duration has lognormal distribution, emergency surgery starts as soon as possible.

Surgery Duration: EOT depends on surgical procedure, ROT has lognormal distribution with mean equal to EOT.

Children / Infectious Patients: at most one child / infectious per surgery block, always scheduled at the beginning / end.

Cancellations and Overtime: overtime is assigned if expected completion time is less than maximum overtime, otherwise surgery is cancelled.

Other Resources: surgical teams and upstream/downstream capacities are considered always available.

Assumptions

Emergencies: at most one emergency per OR block, arrival with fixed probability and uniform distribution over the OR block duration (= overall Poisson process), duration has lognormal distribution, emergency surgery starts as soon as possible.

Surgery Duration: EOT depends on surgical procedure, ROT has lognormal distribution with mean equal to EOT.

Children / Infectious Patients: at most one child / infectious per surgery block, always scheduled at the beginning / end.

Cancellations and Overtime: overtime is assigned if expected completion time is less than maximum overtime, otherwise surgery is cancelled.

Other Resources: surgical teams and upstream/downstream capacities are considered always available.

For instances with higher level of robustness the SAA approach is not able to find a feasible solution when the number of patients increases. SCI's solutions are very close to that of SAA, but it provides always a feasible solution due to RFF.

SAA vs BRKGA

Video presentation - UI

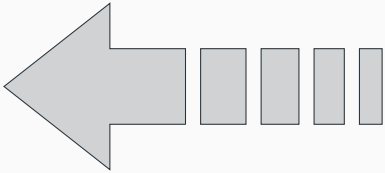
Conclusions

Final Remarks & Future Perspectives

Comprehensive approach to deal with different types of patients under uncertainty;

limitations of SAA methodology as soon as the combinatorial and stochastic complexities increase;

general insights: robustness vs. average performance & non-trivial best solutions.

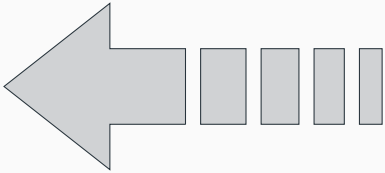


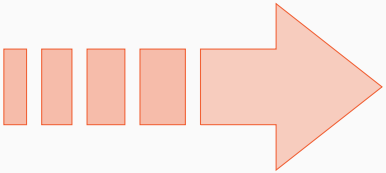
Final Remarks & Future Perspectives

Comprehensive approach to deal with different types of patients under uncertainty;

limitations of SAA methodology as soon as the combinatorial and stochastic complexities increase;

general insights: robustness vs. average performance & non-trivial best solutions.





Integrating SCI and BRKGA;

Alternative real-time policies: stochastic optimization + online optimization;

impact of "robust decisions" over time.

That's all Folks!
